In 2009, the State of Minnesota conducted an ingestion phase exercise with the Monticello Nuclear Generating Plant. Here, Minnesota shares their best practices and their lessons learned. In this presentation, Minnesota gives details including a description of Minnesota's 240 day exercise development timeline, experiences working with FRMAC to develop the maps and sampling data and preparing for the FEMA entrance meeting. In addition, exercise issues such as conducting time jumps and an explanation of the injects used during the scenario to drive the demonstration of criteria such as relocation, describing the restricted zone, re-entry, return, food protections and recovery are also discussed.
